Savannah River Site Environmental Report for 2005
Figure 1 The Savannah River Site
SRS is located in South Carolina, about 12 miles south of Aiken, South Carolina, and about 15 miles southeast of Augusta, Georgia. The Savannah River flows along a portion of the site’s southwestern border.
Figure 2  Radiological Surface Water Sampling Locations
Surveillance and effluent sampling points are near SRS facilities, on site streams, and on the Savannah River.
Figure 3. NPDES Sampling Locations

Twenty-three industrial wastewater outfalls were regulated at SRS in 2005 under NPDES Permit SC0000175.
Figure 4 Radiological Air Surveillance Sampling Locations
The SRS air surveillance program consists of 11 stations located on site or along the site perimeter, as well as three stations approximately 25 miles from the site perimeter (located near the U.S. Highway 301 Bridge over the Savannah River; near the New Savannah Bluff Lock and Dam, also known as the Augusta Lock and Dam; and at the Aiken airport) and one about 100 miles from the site perimeter (near Savannah, Georgia).
Figure 5  SRS Fish Sampling Locations
SRS collects fish (for both radiological and nonradiological analyses) from the Savannah River above, adjacent to, and below the site, as well as at Stokes Bluff Landing and near Savannah, Georgia.
Figure 6 Radiological Soil Sampling Locations
SRS collected soil samples in 2005 from five onsite locations, 10 site perimeter locations, and four offsite locations.
Figure 7  Radiological Sediment Sampling Locations
Sediment samples were collected in 2005 at eight Savannah River locations—upriver of, adjacent to, and downriver of the site—and 19 onsite locations.
Vegetation samples were collected for radiological analysis in 2005 from 13 locations on site or along the site perimeter, and from four offsite locations.
Radioactivity released from SRS operations contaminated the Savannah River Swamp between Steel Creek and Little Hell Landing—an area outside the SRS boundary—during the 1960s. Approximately 25 Ci of cesium-137 and 1 Ci of cobalt-60 were released from the P-Area storage basin to Steel Creek—L-Lake did not exist at the time of the release—and migrated downstream to a part of the swamp.
Figure 10  Savannah River Swamp Sampling Trails
Ten sampling trails were established in the Savannah River Swamp in 1974 so that surveys could be conducted on the movement of contamination from SRS operations.
Figure 11  Nonradiological Surface Water Sampling Locations
Surface water samples are collected from five Savannah River and 11 SRS stream locations and are analyzed for various chemical and physical properties.
Figure 12 Domestic Water Systems
Most of the drinking water at SRS is supplied by three “large” systems. The site also has 14 “small” domestic water facilities, which serve populations of fewer than 25 persons and require a reduced level of regulatory oversight. The three larger systems have transmission pipes, elevated storage tanks, water treatment plants, and a backup water treatment plant.
Figure 13  Nonradiological Sediment Sampling Locations

Sediment samples are collected at eight onsite stream locations and three Savannah River locations. The samples are analyzed for various inorganic contaminants (metals) and pesticides/herbicides.
Figure 14  Sector-Specific Adult Maximally Exposed Individual Air Pathway Doses (in mrem) for 2005
Maximally exposed individual (MEI) site boundary doses from airborne releases are shown for each of the 16 major compass point directions surrounding SRS. In 2005, the N and ENE sectors had essentially the same MEI dose of 0.05 mrem. However, when the third decimal point was considered, the N sector was slightly higher than the ENE sector.
Figure 15  Wind Rose for SRS, 1997–2001
This wind rose graphically depicts the percent of occurrence frequencies of six wind speed categories by 16 cardinal wind direction sectors at SRS. The wind speed categories are defined on the plot; direction is defined as the sector from which the wind blows. The data used to generate the wind rose consist of hourly averages of wind speed and direction at the H-Area meteorological tower for the 5-year period 1997–2001; measurements were taken 200 feet above the ground.
